

**Also known as**

Agar-Agar

**Specification**

Gelling agent selected for solidifying the microbiological culture media.

**Description**

Agar is the dried, hydrophilic, colloidal substance extracted from algae known as Agarophytes (several species and genera of the Class *Rhodophyceae*). It consists of two polysaccharides, agarose and agarpectine, in a variable proportion depending on the geographical zone of origin.

Bacteriological Agar is a solidifying agent selected and prepared by mixing different agars from several geographical zones of origin. It is especially recommended for gelling microbiological culture media where excellent transparency and clarity is required.

**Physico-chemical characteristics**

The most important characteristics are:

**Physical data**

Appearance.....	Fine powder, free flowing
Color.....	Lig. beig- Beig
Melting point (1,5%).....	83-89 °C
Gelling point (1,5%).....	32-39 °C
Gel strength ( <i>Nikan</i> ).....	700 ± 50 g/cm <sup>2</sup>
Dissolution time (at 100°C).....	1,00 min
Turbidity.....	< 7 NTU

**Chemical data**

pH of 1,5% solution at 25°C.....	5,7 - 7,0
Particle size.....	< 0,45 mm
Loss on drying.....	< 8,00 % (w/w)
Residue on ignition.....	< 6,50 % (w/w)
Acid insoluble ash.....	< 0,03 % (w/w)
Calcium.....	300-2500 ppm
Magnesium.....	50-1000 ppm

**Microbiological limits**

Total aerobic microbial count.....	< 1000 CFU/g
Heat resistant thermophiles.....	< 500 CFU/g
Heat resistant mesophiles.....	< 20 CFU/g
Coliforms.....	< 10 CFU/g
Moulds and yeasts.....	< 500 CFU/g
<i>Staphylococcus aureus</i> .....	absent in 10 g
<i>Escherichia coli</i> .....	absent in 10 g
<i>Salmonella</i> spp.....	absent in 25 g

**Storage**

For laboratory use only. Keep tightly closed, away from bright light, in a cool dry place (+4 °C to 30 °C).
